**SOLUTION:** A microcode controller 10 of a microcode control system is provided with a dedicated data processing unit (VU) 31 which can perform a process using a dedicated circuit, a general data processing unit (PU) 32, and a fetch unit 21 which is common to them. This controller 10 can synchronously control the dedicated data processing unit 31 and the general data processing unit 32 with dedicated instructions and general instructions described in microcode on an instruction code level, so that multiprocessing can be performed by these units, without increasing the circuit scale. Consequently, the controller for high-speed processing that has high cost performance which includes the development cost or the like and is suitable for processing which is demanded to be processed in real time and the data processor which uses it can be provided.
